st_vlexists() — Use and manipulate value labels

Description Diagnostics

Syntax Also see

Remarks and examples

Conformability

Description

st_vlexists(name) returns 1 if value label name exists and returns 0 otherwise.

st_vldrop(name) drops value label name if it exists.

st_vlmap(name, values) maps values through value label name and returns the result.

st_vlsearch(name, text) does the reverse; it returns the value corresponding to the text.

st_vlload(name, values, text) places value label name into values and text.

st_vlmodify(name, values, text) creates a new value label or modifies an existing one.

Syntax

real scalar	<pre>st_vlexists(name)</pre>
void	<pre>st_vldrop(name)</pre>
string matrix	<pre>st_vlmap(name, real matrix values)</pre>
real matrix	<pre>st_vlsearch(name, string matrix text)</pre>
void	<pre>st_vlload(name, values, text)</pre>
void	<pre>st_vlmodify(name, real colvector values, string colvector text)</pre>

where *name* is *string scalar* and where the types of *values* and *text* in st_vlload() are irrelevant because they are replaced.

Remarks and examples

stata.com

Value labels are named and record a mapping from numeric values to text. For instance, a value label named sexlbl might record that 1 corresponds to male and 2 to female. Values labels are attached to Stata numeric variables. If a Stata numeric variable had the value label sexlbl attached to it, then the 1s and 2s in the variable would display as male and female. How other values would appear—if there were other values—would not be affected.

Remarks are presented under the following headings:

Value-label mapping Value-label creation and editing Loading value labels

Value-label mapping

Let us consider value label sex1b1 mapping 1 to male and 2 to female.

st_vlmap("sexlbl", *values*) would map the $r \times c$ matrix values through sexlbl and return an $r \times c$ string matrix containing the result. Any values for which there was no mapping would result in "". Thus

st_vlsearch(name, text) performs the reverse mapping:

Value-label creation and editing

st_vlmodify(name, values, text) creates new value labels and modifies existing ones.

If value label sex1b1 did not exist, coding

: st_vlmodify("sexlbl", (1\2), ("male"\"female"))

would create it. If the value label did previously exist, the above would modify it so that 1 now corresponds to male and 2 to female, regardless of what 1 or 2 previously corresponded to, if they corresponded to anything. Other mappings that might have been included in the value label remain unchanged. Thus

: st_vlmodify("sexlbl", 3, "unknown")

would add another mapping to the label. Values are deleted by specifying the text as "", so

: st_vlmodify("sexlbl", 3, "")

would remove the mapping for 3 (if there was a mapping). If you remove all the mappings, the value label itself is automatically dropped:

: st_vlmodify("sexlbl", (1\2), (""\""))

results in value label sex1b1 being dropped if 1 and 2 were the final mappings in it.

Loading value labels

st_vlload(*name*, *values*, *text*) returns the value label in *values* and *text*, where you can do with it as you please. Thus you could code

Conformability

st_vlexists(name): 1×1 name: result: 1×1 st_vldrop(name): 1×1 name: result: void st_vlmap(name, values): name: 1×1 values: $r \times c$ result: $r \times c$ st_vlsearch(name, text): 1×1 name: $r \times c$ text: result: $r \times c$ st_vlload(name, values, text): input: 1×1 name: output: $k \times 1$ values: $k \times 1$ text: st_vlmodify(name, values, text): 1×1 name: values: $m \times 1$ text: $m \times 1$ void result:

Diagnostics

The only conditions under which the above functions abort with error is when *name* is malformed or Mata is out of memory. Functions tolerate all other problems.

st_vldrop(name) does nothing if value label name does not exist.

st_vlmap(*name*, *values*) returns J(rows(values), cols(values), "") if value label *name* does not exist. When the value label does exist, individual values for which there is no recorded mapping are returned as "".

st_vlsearch(*name*, *text*): returns J(rows(values), cols(values), .) if value label *name* does not exist. When the value label does exist, individual text values for which there is no corresponding value are returned as . (missing).

st_vlload(*name*, *values*, *text*): sets *values* and *text* to be 0×1 when value label *name* does not exist.

st_vlmodify(*name*, *values*, *text*): creates the value label if it does not already exist. Value labels may map only integers and .a, .b, ..., .z. Attempts to insert a mapping for . are ignored. Noninteger values are truncated to integer values. If an element of *text* is "", then the corresponding mapping is removed.
