

# Advanced Data Visualizations with **Stata**: Part V

## Hierarchical data

Asjad Naqvi

Stata Oceania Conference  
9 February 2023

## Why we need more #StataViz?

- A lot of potential given the existing Stata/Mata structure
- Lots of exciting developments in terms of dataviz packages in the past years.
- Own packages: **bimap**, **joyplot**, **streamplot**, **clipgeo**, **delaunay**, **marimekko**, **arcplot**, **treemap**, **circlepack**, **circlebar**, **spider**, **sankey**, **alluvial**, **treecluster**
- Plus several other packages by the community have been released
  
- Today we will discuss some of these packages that deal with heirarchical data

# Hierarchical data

- Data visualization dealing with hierarchical data can be split into three groups
  - Stocks
  - Flows
  - Stocks and flows
- Adding other dimensions, like time, makes the data structures fairly complex
- Existing packages make these visualizations easier:
  - [circlepack](#), [circlebar](#), [treemap](#), [sankey](#), [treecluster](#)
- We will discuss some applications using the same data

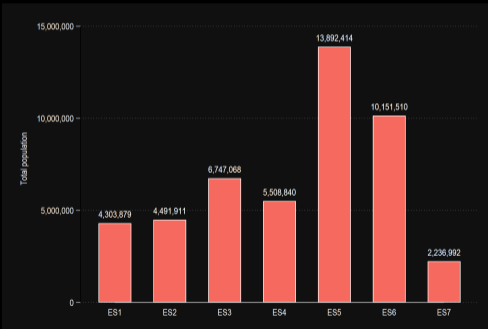

## Hierarchical data examples

- Hospitals, doctors, patients
- Schools, teachers, students
- Budgets
- Populations at different admin units

241	DE	DE2	DE23	DE232	153,094					

## Single layer stocks

Stocks of single layers can be easily visualized using in-built packages, for example population of Spanish NUTS1 regions

## Single layer packages

Stocks of single layers can also be easily visualized using custom packages, e.g. [circlebar](#)

Hierarchical stocks: `circlepack`

- Plot nested lists as circles within circles.
- Circle packing requires a packing algorithm that maximize the area of a starting circle, such that no circles overlap.

→ `ssc install circlepack, replace`

# Hierarchical stocks: [circlepack](#)

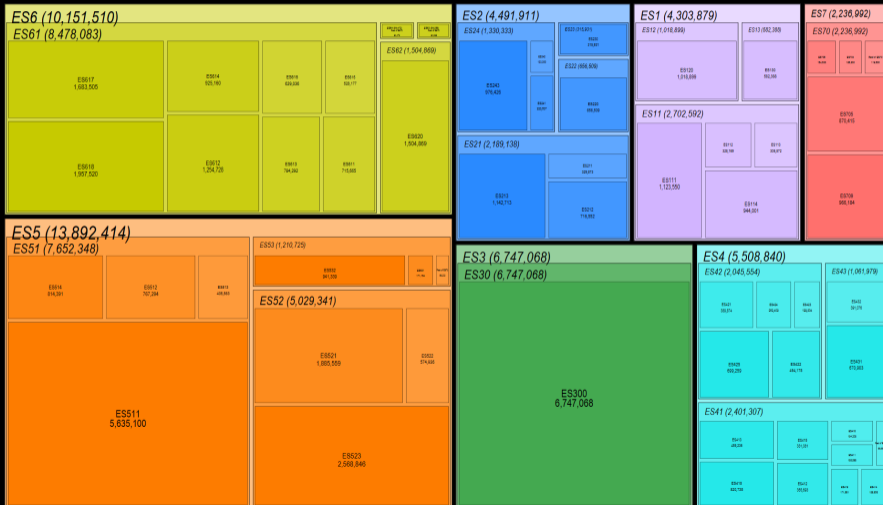

## Hierarchical stocks: `treemap`

- Treemaps plot nested lists as rectangles within rectangles.
- `treemap` uses the “squarify” tiling algorithm (also used by OEC, OWID, D3js).
- “squarify” optimizes placement of tiles to approach a desired aspect ratio.
- Tiles are sorted by largest-to-smallest size, and iteratively placed by either “slicing” or “dicing” a starting rectangle, until all tiles are close to the desired aspect ratio.

→ `ssc install treemap, replace`

# Hierarchical stocks: `treemap`

Hierarchical stocks: **treemap**

## Hierarchical stocks: `sunburst`

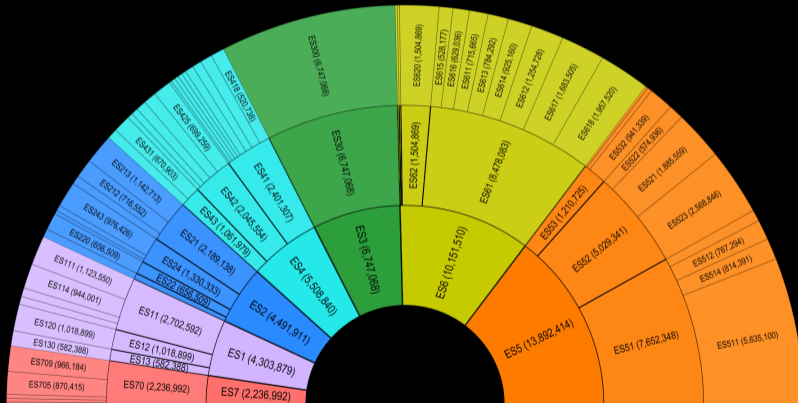

- Layers are stacked on top of each other in a semi-circle.
- Arc lengths represent proportion
- Allows complete customization of layers

→ `ssc install sunburst, replace`

# Hierarchical stocks: [sunburst](#)

# Hierarchical stocks: **sunburst**

## Hierarchical stocks: [sankey](#)

- Sub-division of stocks are shown as flows.
- Flows across categories.
- Allows complete customization of layers

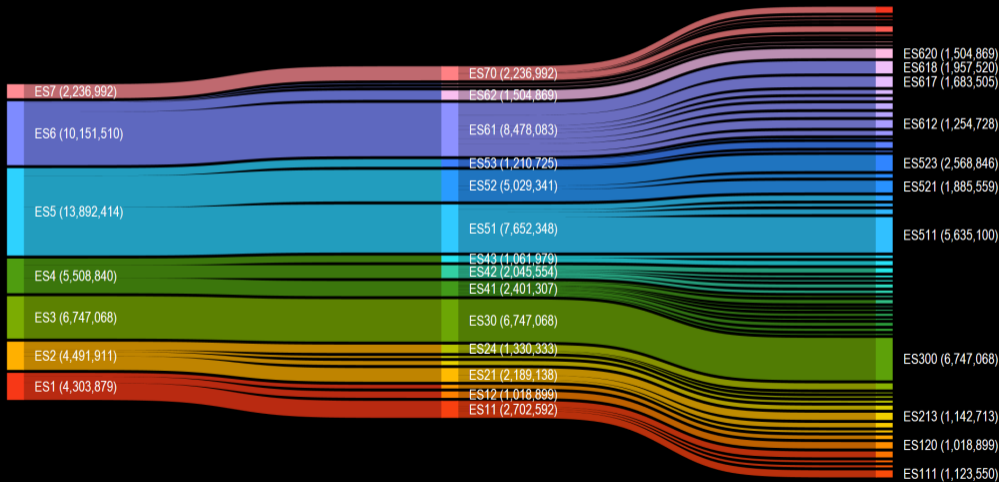

→ `ssc install sankey, replace`

# Hierarchical stocks: sankey

# Hierarchical stocks: sankey

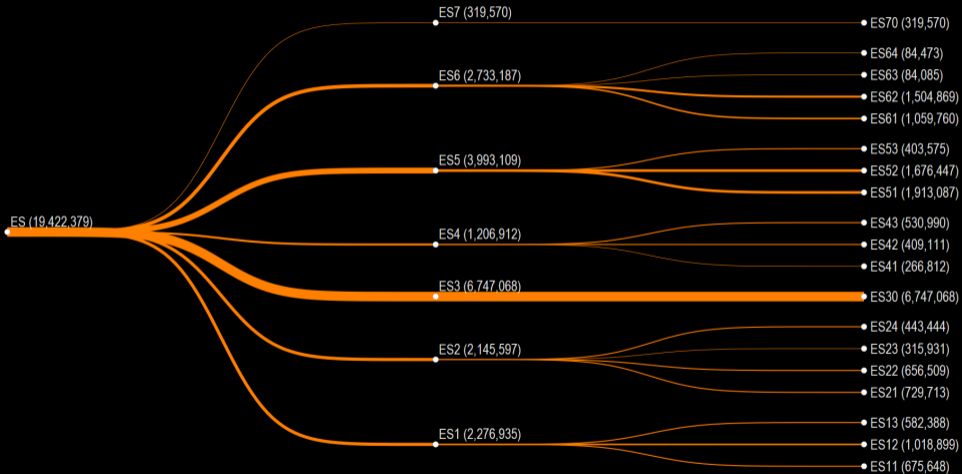

## Hierarchical stocks: `treecluster`

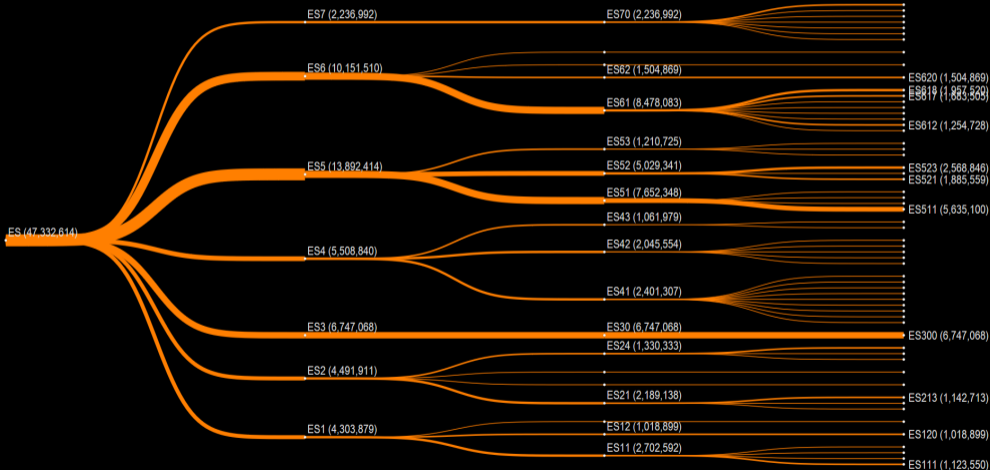

- Layers are shown in a tree structure.
- Trees can be horizontal or radial
- Allows complete customization of layers

→ `ssc install treecluster, replace`

# Hierarchical stocks: `treecluster`

# Hierarchical stocks: `treecluster`

# Hierarchical stocks: treecluster

## Hierarchical flows

- Hierarchical flows occur across and within layers.
- Even within layers bi-directional flows make data visualizations complex.
- We use the recently-published bi-lateral migration flows dataset:

*Abel, G., Cohen, J. (2022). Bilateral international migration flow estimates updated and refined by sex. Scientific Data 9, 173. DOI: <https://doi.org/10.1038/s41597-022-01271-z>*

- The data is estimated for country-country pairs, at 5 year intervals, and by gender
- Data is collapsed at the sub-region, and all migration

# Hierarchical flows: `sankey`

# Hierarchical flows: `chord`

## What can be improved

- **Ability to read image data**
- Plotting by colors
- Making shapes, for example, circles should be easier
- Allow angles, sizes, colors, clock positions, etc. to be read from variables or macro lists (like mlabels)
- Line weights (like marker weights)
- Allow adding custom markers (or increase marker pool)
- Allow colored text in graphs
- Ability to overlay images in figures
