- ① How to measure MDP?
- ② What mpitb can and cannot do
- ③ The basic syntax
- ④ Examples

How to measure MDP?

Alkire and Foster (2011) and Alkire, Foster, et al. (2015)

Identification (who is poor?)

- individuals or households $i = 1, \dots, N$
- (binary) deprivation indicators $j = 1, \dots, D$
- deprivation score c_i relying weights $0 \leq w_j \leq 1$ with $\sum w_j = 1$
- individual is poor if $c_i \geq k$ (poverty cutoff)

Aggregation (how much poverty?)

- headcount ratio H
- intensity A
- adjusted headcount ratio $M = H \times A$
- deprivation rate h_j and censored deprivation rate: $h_j(k)$

What mpitb can and cannot do

mpitb can

- **estimate key quantities** for MDP analysis (incl. their SE)
- for **parameter sets** (e.g., cutoffs) and **subgroups** (e.g., regions)
- facilitate **cross-country** estimation and analysis.

Why care?

- 10 indicators, 11 cutoffs for national, urban-rural, 20 regions
- 8601 point estimates $((33 \times 11 + 10) \times 23 + 22)$

Main benefits

- save time for programming and estimation
- efficient workflow with well-structured results, facilitates replication, bug tracking, cross-checks
- adopt commands from akin projects (e.g., graphs)

quantity	level	change ¹
adj. headcount ratio	•	•
headcount ratio	•	•
intensity	•	•
censored depr. rate	•	•
uncensored depr. rate	•	•
absolute ind. contr.	•	
percentage ind. contr.	•	
indicator non-response	•	
retained sample	•	

Notes: ¹ may be reported as (i) absolute or relative, (ii) annualised or raw.

mpitb cannot

- generate deprivation indicators
- make normative decisions
- prevent estimation of wrong or meaningless numbers
- provide every number needed a particular research project

The basic syntax

mpitb set

```
mpitb set [ , name(mpiname)
            d1(varlist, subopts) ... d5(varlist, subopts)
            description(text) clear replace ]
```

mpitb est

```
mpitb est , name(mpiname) [ ...
    klist(numlist) weights(wgts sopts)
    measures(mlist) indmeasures(imlist) aux(auxlist)
    lframe(name [, sopts]) lsave(filename [, sopts])
    over(varlist [, sopts])
    ...
]
```

Examples

Example 1: A single year for a single country

```
. use syn_cdta.dta if t == 1 , clear
. sum
```

Variable	Obs	Mean	Std. dev.	Min	Max
d_nutr	7,439	.2521844	.4342958	0	1
